Material	<p>The Pulex rubber blades are real vulcanised natural rubber (NR) that are compression moulded, item by item, from a meter-long strip by compression moulding machines. The mix of NR rubber has to be processed carefully and is free from impurities having all the necessary properties concerning molecular dispersion, cross-linking, elasticity, snap, resilience, hardness, resistance to chemical and atmospheric agents, colouring and surface smoothness. Thanks to the addition of various special additives formulated through over two decades of research and development, the grade of the mix of Pulex rubber is specifically calibrated for cleaning glass. The rubber strip, as said before, is moulded using a high power press, and cut in half by sophisticated machinery using a special process. This gives a blade that is about a metre long and has a very sharp edge. At the end of the process, for detecting all possible defects, Pulex utilises its own exclusive optical and electronic and computerised control machine. Exploratory laser rays <i>read</i> the degree of perfection of the cut and the two sharp edges of the blade. So, all Pulex rubber blades, having 51-54 Shore degrees in the “standard” version and 46-48 Shore degrees in the “soft” version are TQR (Total Quality Rubber) because they undergo under this computerised optical and electronic test, assuring that they are free from even microscopic defects in the surrounding area of work of the blade on the window.</p>
